The photograph on the dust jacket, taken near Williams, Colusa County, California, shows a valley typical of the Coast Range. The sinuous ephemeral stream is incised in the alluvium forming the valley flat. The dark areas in the swales and low spots are those producing saturated overland flow. Hortonian overland flow is probably the main runoff-producing process on the steep hillslopes.

Photograph on dust jacket is copyrighted by William A. Garnett.

By emphasizing calculations, I avoid costly environmental problems provided at the facilities. I will be of interest to those who are concerned with the description of the hyperosmotic issues.

Following in the context of environmental change, the book is divided into three parts: water, climate, and land. The first part, water, deals with the impact of water on the environment, the second part, climate, deals with the impact of climate on the environment, and the third part, land, deals with the impact of land on the environment.
